HMG-MYSYNC (New Version)

brunellopulix@gmail.com

I completely rewrote the procedure adding new options and correcting any inaccuracies I found.

I tested the procedure daily for a few months until I reached an optimal level of efficiency.

New options:

- Added subdivision by groups
- Added the ability to connect to different **Leto IP** addresses
- Possibility of using a timer for starting
- Clone an existing record
- Only one Harbor option used for the zip function
- Ability to activate by group

Changed:

- Once the synchronization has been performed, the **OFF** Flag does not go automatically, it must be changed manually

Usage:

for local transfers or with network mapping, always indicate the Source drive and the Target drive.

For **LETO** transfers **DO NOT** indicate the drive to **LETO** example:

From LETO:

Origin: \ Folder1

Target: F: \ Folder1

To LETO:

Origin: F: \ Folder1
Target: \ Folder1

Remember: Transfers to and from **LETO** are always incremental.

It is also possible to indicate similar paths:

Origin: C: \ Folder1
Target: D: \ Folder1

or different paths:

Origin: C: \ Folder1

Target: D: \ Folder1 \ Sub1

Or:

Origin: C: \ Folder1 \ Sub1

Target: D: \ Folder1 \ Sub1 \ Sub2

If you are using a previous version, I recommend that you use this version.
