At start

You have hmgcase.exe and add folder with icons (bmp) and sbr lov.prg with basic functions.

You probably have a folder with your data, DBF and NTX, select it

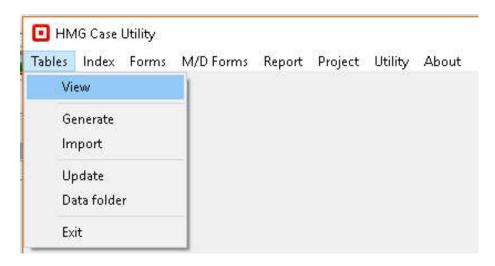

Just start hmgcase.exe

What's happend? Nothing or something?

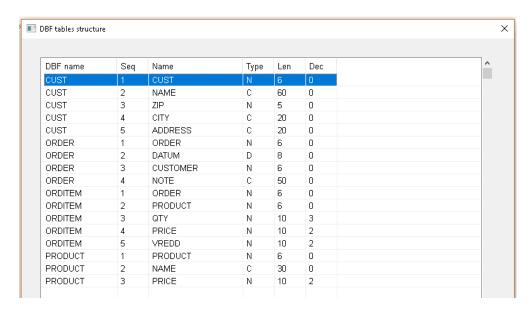

Note: table is DBF file

Tables

View

Click on Tables-View you can see table structure

When exit program you can see open_dbf.prg with table structure, function create table if not exsist.

Sample:

```
*:***************
*: Program OPEN_DBF.PRG

*:*****************

PROCEDURE open_dbf

LOCAL alist_fld

if ! file ("CUST.dbf")
    alist_fld := {}
    aadd(alist_fld, {"CUST", "N", 6, 0})
    aadd(alist_fld, {"NAME", "C", 60, 0})
    aadd(alist_fld, {"ZIP", "N", 5, 0})
    aadd(alist_fld, {"CITY", "C", 20, 0})
    aadd(alist_fld, {"ADDRESS", "C", 20, 0})
    dbcreate("CUST", alist_fld)
endif
```

etc

Generate

Create open_dbf.prg

Import

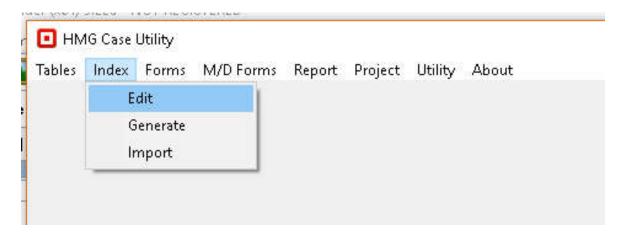

After change structure you can import new structure

Update

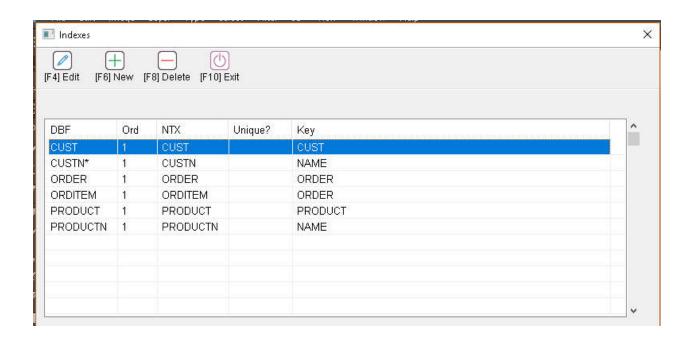

On table right click you have two option, delete from data dictionary or update structure.

Index

For index maintaince

Edit

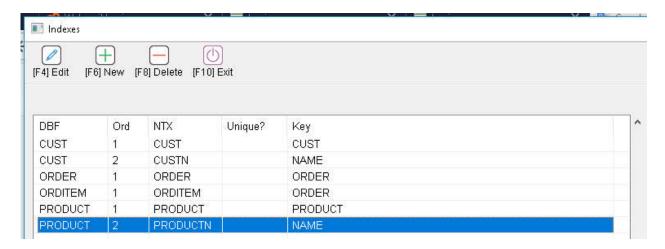

Import

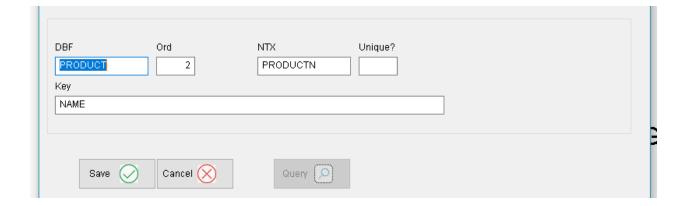

Like table, program import indexes. One table can have many indexes,

If the table has multiple index then you must mark it help: if there is no table like index then it is marked with * at the end

like in this case

Edit, New or Delete can be with Function keys or click on button.

Generate

After change indexes you can create **open_ntx.prg**, function for create indexes if not exsist, and function for reindex.

Sample:

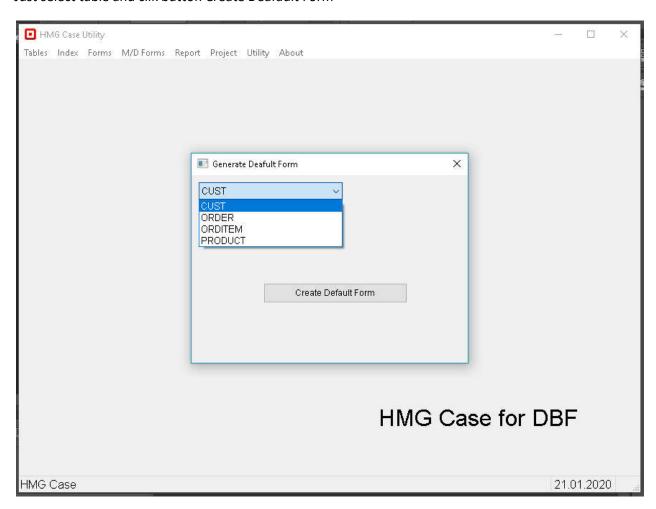

```
*: Program OPEN NTX.PRG
PROCEDURE open_ntx
if ! file ("CUST.ntx")
 use CUST
 index on CUST to CUST
 use
endif
etc
RETURN
*: Program RE INDEX.PRG
PROCEDURE re index
 DELETE FILE CUST.ntx
etc
  open_ntx()
RETURN
```

Forms

Create simple form, one table on screen.

Default

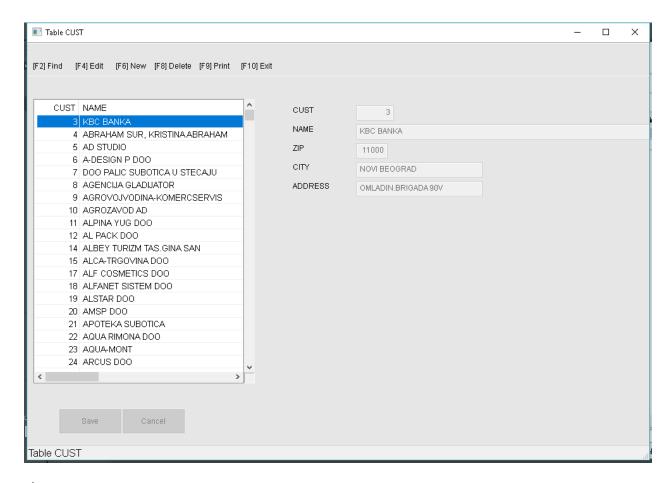

Just select table and clik button Create Deafault Form

If you want quick program, select Forms->Generate and be create edit_1.prg

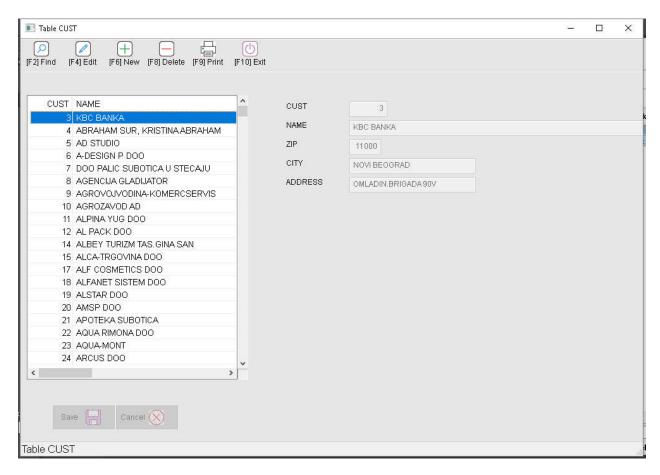

Build edit_1.prg

And see

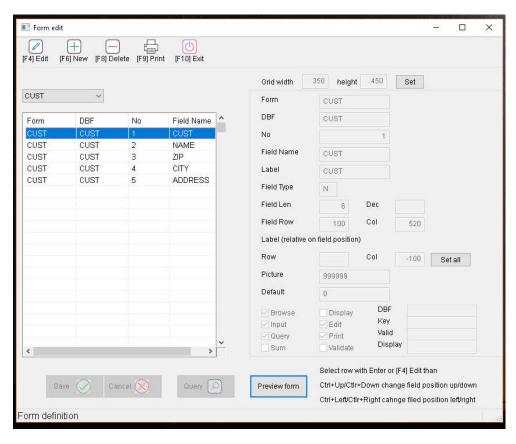

It's run program in minute

Look TOOLBAR, have all function for data manipulation: Find, Edit, New, Delete, and finish action with Save or Cancel. No icons, but if copy added icons program have new appearance.

Icons are in BMP, you have use yours.

EditWhen clik this option you can see like this. Left grid are fields, on the right field definition.

Button Preview Form display field positon on screen.

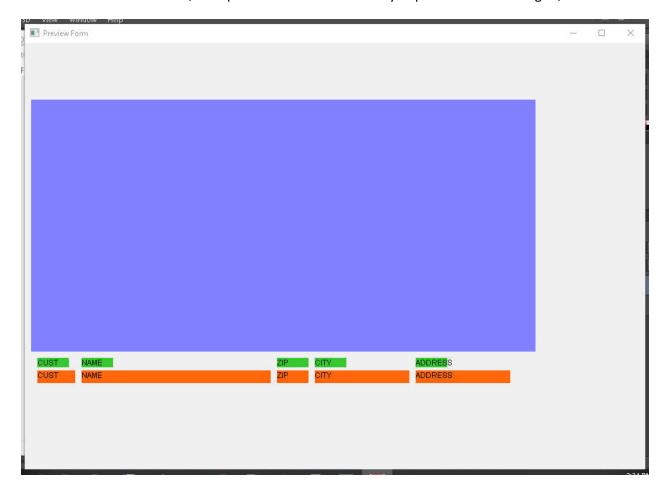

Note: both window see on Full HD monitor(1920x1080)

Now you can change grid, top button Set.

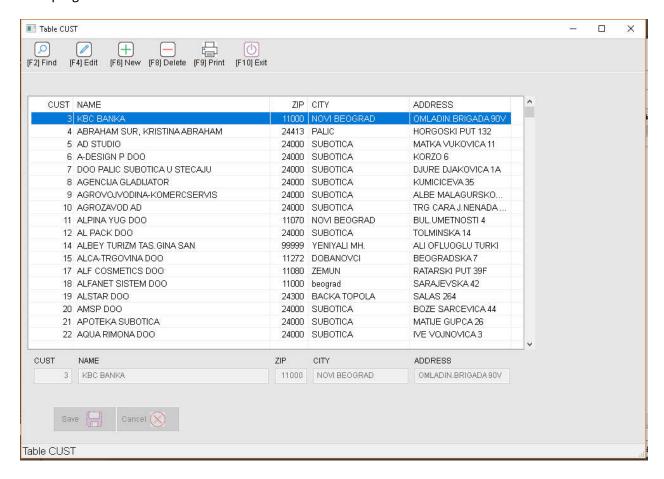

For field: you change row and col position, picture and default value. Edit with F4 or Enter. Quick change position with Ctrl + Up/Down (row) and Ctrl+left/Right key (col).

Field and label position

Label will be display before filed, defined down of field position. Default is 0,-100 that is left from filed. You can set all labels like -20, 0 is up on the field. This is when you position filed under grid, like

Then program run like

Insert or delete field

Delete is simple, just press F8 and confirm. It is not necessary for all fields to be displayed.

Insert field, press F6. DBF is \$ (display only), enter field name, type and position. This is simple form, not necessary for this field and no sample use display field.

Attribute field

Browse – is display on grid, with Input and Edit you can enable/disable for Input or Edit value.

When need Sumary set Sum, and sum be display on screen.

Validate – control with List of Value will be explained later

Generate

Just select form and Generate. Next step is compile.

This is simple Form program, one table with grid and all fields on screen.

Functions key

In all created programs Function key are same.

F2 – **Find**, press F2 or clik on Find button, enter search criteri and click on Query. Than be display record with select criteria.

F4 - Edit

F6 - New

F8 - Delete

F9 - Print

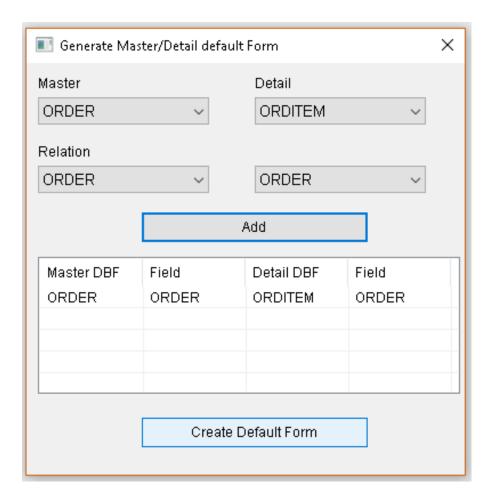

F10 - Exit

M/D Forms

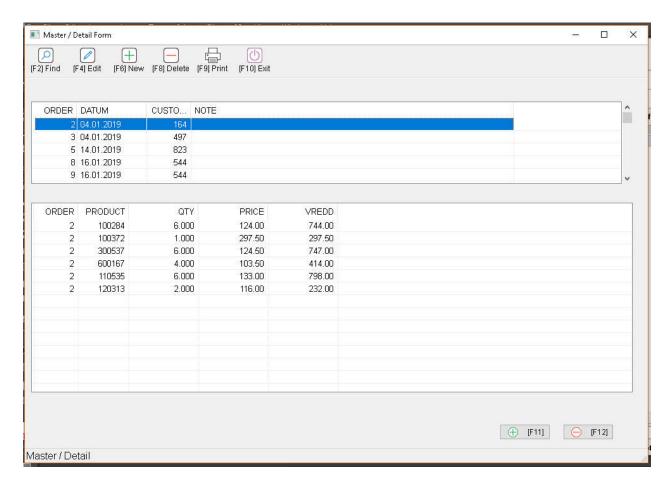

Create Master-Detail Form program, two tables in relations.

Default

Like simple form, in this case you can select two tables, one master and detail, and relation fields, accept with Add button, and nest filed relation. At end clik on Create Default Form.

After Generate and compile you can see like

Edit

We have orders and product items on display

If we have a code it would be nice to show a description too, an example is the customer and his name should be shown, we can also show the product name

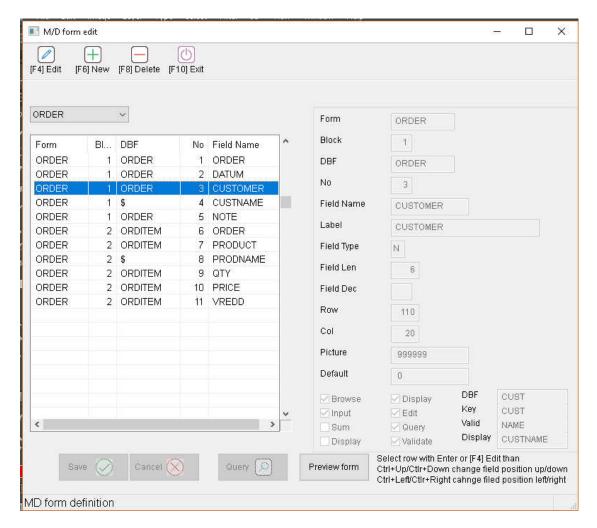

First step, create filed for display names, customer and product.

Insert two field, block 1, CUSTNAME, type C, len 20, position 110,90

And block 2, PRODNAME, type C, len 20, position 130,170

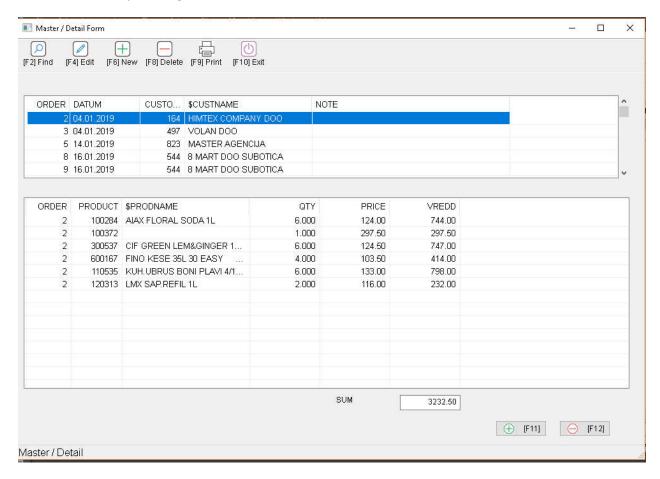

Customer name is table CUST, key CUST, display NAME

Product name is table PRODUCT, key PRODUST, display NAME

Also you can select Sum for field VREDD.

Generate and compile. Program now look like

Program can be nicer, you can change HEADER on BROWSE and GRID, and hide some filed in detail table, set WITHS to 0 (like field ORDER).

Generate

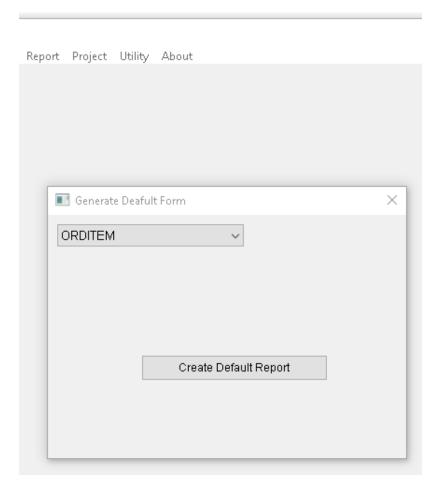

Just select form and Generate. Next step is compile.

This is Master-Detail Form program, one master table with detail table.

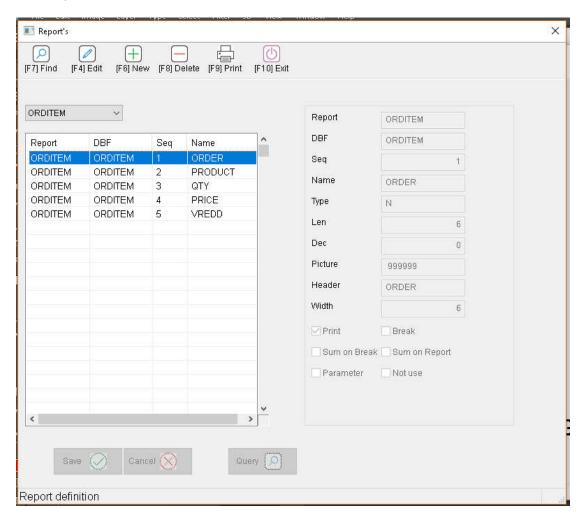

Report

Default

First step is select table and Create Default Report

Edit Next step look like Form Edit

Just generate and look Report.

Than change fields, Header, Picture, Width. If you need SUM of field set **Sum on Report,** if need Group set group filed (in this case ORDER), and **Sum on Break**. Generate and compile.

Now report look like (last page)

)ate: 24.01.2020				TITLE of Report	Page: 65
ORDER	PRODUC QTY		PRICE	VREDD	
462	700051	4.000	302.00	1208.00	
	13782	4.000	129.00	516.00	
	21696	6.000	95.00	570.00	
	868365	12.000	114.50	1374.00	
	120313	6.000	101.50	609.00	
	120413	6.000	88.00	528.00	
	120176	6.000	85.50	513.00	
	23619	6.000	75.50	453.00	
	210293	3.000	1270.00	3810.00	
	72206	4.000	885.25	3541.00	
	14279	12.000	139.60	1675.20	

sum				23484.70	

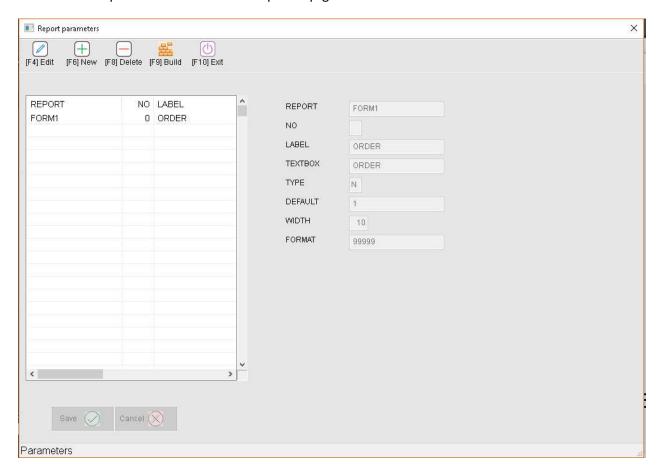

Generate

When field defined just Generate and Compile.

Parameters

Report usually need parameters, this is for create param.prgthen insert in report

Insert field and press F9 Build than create param.prg

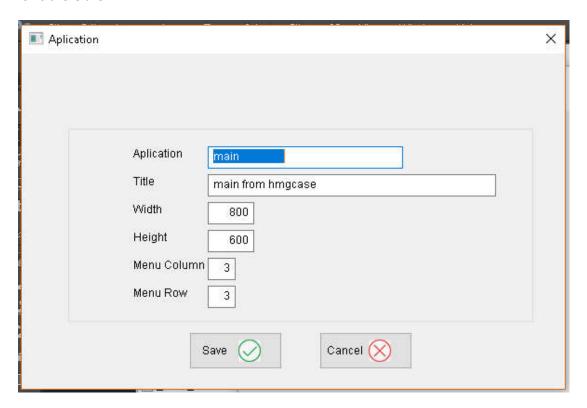

Project

Aplication

If the program has more features / options then it probably has a menu that will display it in a nicer way

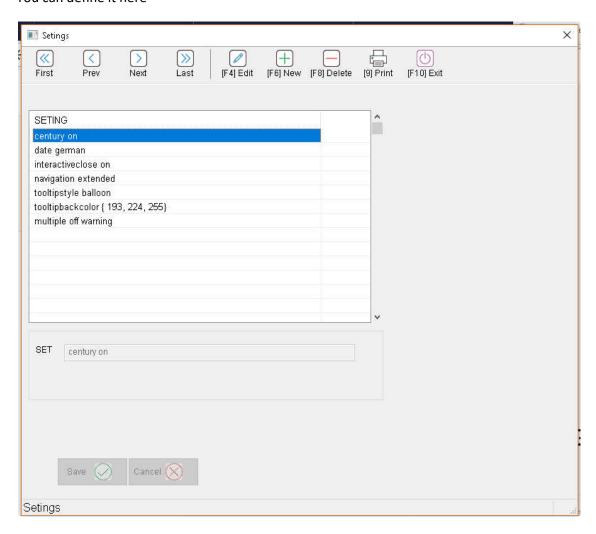

Here you choose what the app is called, the title, the size of the window and how many columns and rows there are

Setting

Each program has its default settings at the beginning of the program

You can define it here

Menu

The next step is to define the names of the columns and rows in the menu

level 0 is basic, columns

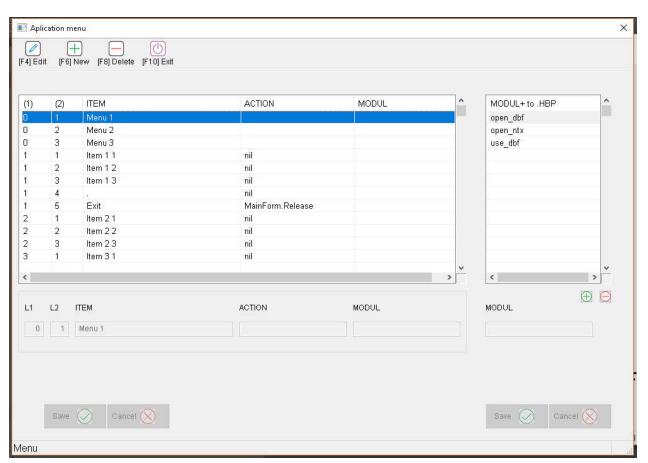

then define the column, row

item: name

action: function, procedure

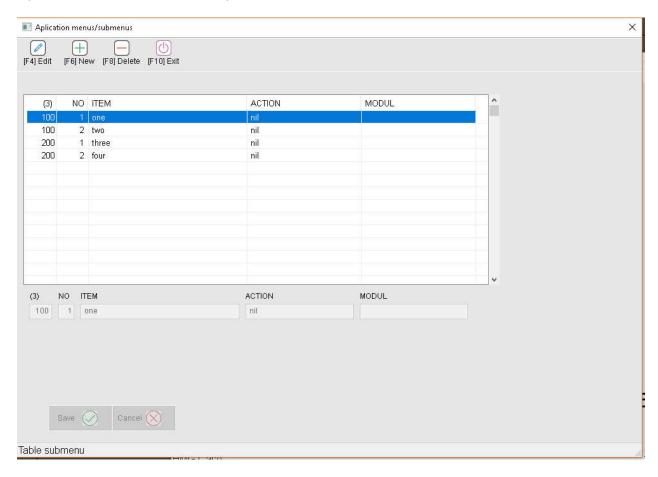

module: program

if you have common features you can add it to the right handbar, the programs you specify will be added to the .hbp file

Submenu

If you need more menu item, this option can define.

Generate

When menu defined next step is Generate, result is main.prg and main.hbp (main je application name which you defined in Project->Aplication

Make Install

If you want create install package with InnoSetup (https://www.jrsoftware.org/isinfo.php) this option help to create .iss file

Prepare generated program for menu

Programs were generated to work on standalone, only compilation needed. When they are part of an application and are called through the menu then some changes need to be made.

Two changes need to be made, the added programs were added with the SET PROCEDURE command and this should be excluded, the following is that only one WINDOW in the program can be MAIN, should be changed to MODAL.

```
#include <hmg.ch>
PROCEDURE MAIN // for test, usually edit_CUST
   PUBLIC NewRec != .F., EditRec != .F., FindRec != .F., FiltRec != .F., _qry_exp != ""
   set navigation extended
   set deleted on
   set date german
   set century on
   set procedure to open_dbf // for test <<<
set procedure to open_ntx // for test <<<
set procedure to Use_dbf // for test <<<
   open_dbf()
   open_ntx()
   set procedure to sbr_lov // for test <<<
   open_2357()
   DEFINE WINDOW Win_1;
      AT 0,0;
      WIDTH 1000 :
      HEIGHT 700;
      TITLE "Table CUST" ;
      \mbox{MAIN} ; // for test, usually MODAL ; <<<
      ON RELEASE dbcloseall();
      BACKCOLOR { 230, 230, 230 }
```

Utility

Some usefull functions

List on functions

Create list of functions in all programs

List of pictures

Create list of pictures in programs and create .rc file
